

作业1 2026/4/11 高数: 1, 2, 3...

1. 直接计算两个序列 $x(n)$ 和 $h(n)$ 的卷积, 其中:

$$x(n) = \left(\frac{1}{6}\right)^{n-6} u(n), \quad h(n) = \left(\frac{1}{3}\right)^n u(n-3).$$

解: $y(n) = x(n) * h(n) = \sum_{k=-\infty}^{\infty} x(k) h(n-k)$

先算非零定义域: ① $x(k) \neq 0 \Rightarrow k \geq 0$, 则 $x(k) = \left(\frac{1}{6}\right)^{k-6}$

② $h(n-k) \neq 0 \Rightarrow n-k \geq 3, k \leq n-3$

$$\text{则 } h(n-k) = \left(\frac{1}{3}\right)^{n-k}$$

$$\therefore y(n) = \sum_{k=0}^{n-3} \left(\frac{1}{6}\right)^{k-6} \left(\frac{1}{3}\right)^{n-k}$$

合并: $y(n) = \sum_{k=0}^{n-3} 6^6 \cdot \left(\frac{1}{3}\right)^n \left(\frac{1}{2}\right)^k = 6^6 \left(\frac{1}{3}\right)^n \sum_{k=0}^{n-3} \left(\frac{1}{2}\right)^k$

$$\therefore y(n) = 6^6 \cdot \left(\frac{1}{3}\right)^n \cdot \frac{1 - \left(\frac{1}{2}\right)^{n-2}}{1 - 1/2} = 2 \times 6^6 \times \left(\frac{1}{3}\right)^n \cdot [1 - \left(\frac{1}{2}\right)^{n-2}]$$

$$\therefore \text{综上, } y(n) = \begin{cases} 0, & n < 3 \\ 2 \times 6^6 \times \left(\frac{1}{3}\right)^n - 8 \times 6^6 \times \left(\frac{1}{6}\right)^n, & n \geq 3 \end{cases}$$

2. 直接计算卷积 $y(n) = x(n) * h(n)$, 其中:

$$a). h(n) = \begin{cases} \alpha^n, & 0 \leq n \leq N-1 \\ 0, & \text{其他} \end{cases} \quad x(n) = \begin{cases} \beta^{n-n_0}, & n \geq n_0 \\ 0, & n < n_0 \end{cases}$$

b). 这里 $\alpha \neq \beta$.

解: $y(n) = x(n) * h(n) = \sum_{k=-\infty}^{\infty} h(k) x(n-k)$

非零范围: ① $h(k) \neq 0 \Rightarrow 0 \leq k \leq N-1, h(k) = \alpha^k$

② $x(n-k) \neq 0 \Rightarrow n-k \geq n_0, x(n-k) = \beta^{(n-k)-n_0}$

$$\therefore y(n) = \sum_{k=0}^{n-n_0} \alpha^k \cdot \beta^{(n-k)-n_0} \quad (\text{必须 } n-n_0 \geq 0)$$

$\therefore$ (1). 若 $n < n_0$, 则无 k 满足, $y(n) = 0$

(2). 若 $n \geq n_0$, 则先求 k 的上限:

① $n_0 \leq n \leq n_0 + N - 1$, 则 $n - n_0 \leq N - 1$, 上限为 $n - n_0$.

$$y(n) = \sum_{k=0}^{n-n_0} \alpha^k \beta^{(n-k)-n_0} = \beta^{n-n_0} \sum_{k=0}^{n-n_0} \left(\frac{\alpha}{\beta}\right)^k$$

$$= \beta^{n-n_0} \cdot \frac{1 - \left(\frac{\alpha}{\beta}\right)^{n-n_0+1}}{1 - \alpha/\beta} = \frac{\beta^{n-n_0+1} - \alpha^{n-n_0+1}}{\beta - \alpha}$$

③ $n \geq n_0 + N - 1$, 上限为 $N - 1$ $\checkmark$

$$\therefore y(n) = \sum_{k=0}^{N-1} \alpha^k \beta^{(n-k)-n_0} = \beta^{n-n_0} \frac{1 - \left(\frac{\alpha}{\beta}\right)^N}{1 - \alpha/\beta}$$

$$= \frac{\beta^{n-n_0+1} - \alpha^N \beta^{n-n_0-N+1}}{\beta - \alpha}$$

$$\therefore \text{综上, } y(n) = \begin{cases} 0, & n < n_0 \\ \frac{\beta^{n-n_0+1} - \alpha^{n-n_0+1}}{\beta - \alpha}, & n_0 \leq n \leq n_0 + N - 1 \\ \frac{\beta^{n-n_0+1} - \alpha^N \beta^{n-n_0-N+1}}{\beta - \alpha}, & n \geq n_0 + N - 1 \end{cases}$$

④ 可用直接增益速算。
设 $h(n) = 3 \times \left(\frac{1}{2}\right)^n u(n) - 2 \times \left(\frac{1}{3}\right)^{n-1} u(n)$ 为一个线性移位不变系统的单位采样响应。如果该系统输入一个单位阶跃信号: $x(n) = \begin{cases} 1, & n \geq 0 \\ 0, & n < 0 \end{cases}$ 求 $\lim_{n \rightarrow \infty} y(n)$, 其中 $y(n) = h(n) * x(n)$ 。

解: 求 $\lim_{n \rightarrow \infty} y(n)$, 其中 $y(n) = h(n) * x(n)$ 。
① 就是 $u(n)$ $\checkmark$

解: $y(n) = \sum_{k=-\infty}^{\infty} h(k) u(n-k) = \sum_{k=-\infty}^{\infty} h(k) \quad (n \geq 0)$

$$\text{因此 } y(n) = \sum_{k=-\infty}^{\infty} h(k) = \sum_{n=0}^{\infty} [3 \times \left(\frac{1}{2}\right)^n - 2 \times \left(\frac{1}{3}\right)^{n-1}]$$

$$= \sum_{n=0}^{\infty} [3 \times \left(\frac{1}{2}\right)^n - 6 \times \left(\frac{1}{3}\right)^n]$$

$$= 3 \times \frac{1}{1 - 1/2} - 6 \times \frac{1}{1 - 1/3} = 3 \times 2 - 6 \times \frac{3}{2} = -3$$

4. 求下列每一个序列的离散时间傅里叶变换(DTFT):

a). $x(n) = \left(\frac{1}{2}\right)^n u(n+3)$, b). $x(n) = \begin{cases} \left(\frac{1}{2}\right)^n, & n=0, 2, 4 \\ 0, & \text{其他} \end{cases}$

解: a). 由于有 $u(n+3)$, 故 $n \geq -3$ 时才有 $x(n) = \left(\frac{1}{2}\right)^n$

$$\text{DTFT: } X(e^{j\omega}) = \sum_{n=-3}^{\infty} \left(\frac{1}{2}\right)^n e^{-j\omega n}, \text{ 令 } m = n+3$$

$$\text{则 } X(e^{j\omega}) = \sum_{m=0}^{\infty} \left(\frac{1}{2}\right)^{m+3} e^{-j\omega(m+3)} = \left(\frac{1}{2}\right)^{-3} e^{-j\omega 3} \sum_{m=0}^{\infty} \left(\frac{1}{2}\right)^m e^{-j\omega m}$$

$$= 8e^{j\omega} \cdot \frac{1}{1 - \frac{1}{2}e^{-j\omega}} = \frac{8e^{j\omega}}{1 - \frac{1}{2}e^{-j\omega}} \quad (|e^{-j\omega}|=1, \text{收敛})$$

$$\therefore X(e^{j\omega}) = \frac{8e^{j\omega}}{1 - \frac{1}{2}e^{-j\omega}}$$

b). 又存在极点非零, 故 $X(z) = (\frac{1}{2})^m = (\frac{1}{4})^m$

$$\therefore X(e^{j\omega}) = \sum_{m=0}^{\infty} (\frac{1}{4})^m e^{-j\omega m} = \sum_{m=0}^{\infty} (\frac{1}{4}e^{-j\omega})^m$$

$$= \frac{1}{1 - \frac{1}{4}e^{-j\omega}}, \text{收敛要求 } |e^{-j\omega}/4| = \frac{1}{4} < 1 \text{ 也成立}$$

$$\therefore X(e^{j\omega}) = \frac{1}{1 - \frac{1}{4}e^{-j\omega}}$$

因为 $\cos(\theta - \pi) = -\cos\theta$, 故 $w(n) = \frac{1}{2} - \frac{1}{2}\cos\frac{2\pi n}{N}$

$$\therefore w(n) = \frac{1}{2} - \frac{1}{4}e^{j\frac{2\pi n}{N}} - \frac{1}{4}e^{-j\frac{2\pi n}{N}}, \text{对其分别做DFT:}$$

①. $\text{DFT}[\frac{1}{2}] = \frac{1}{2}N\delta(k)$ ← 离散域下 $\delta(k)$ 仅在 $k=0$ 时为1

②. $\text{DFT}[-\frac{1}{4}e^{j\frac{2\pi n}{N}}]$ 相当于频谱右移一位, $-\frac{1}{4}N\delta(k-1)$

③. $\text{DFT}[-\frac{1}{4}e^{-j\frac{2\pi n}{N}}]$ 相当于频谱左移一位, $-\frac{1}{4}N\delta(k+1)$

在 $\text{mod } N$ 下, 结果为: $W(k) = \frac{N}{2}\delta(k) - \frac{N}{4}\delta(k-1) - \frac{N}{4}\delta(k+1)$

$$\text{即 } W(0) = \frac{N}{2}, W(1) = -\frac{N}{4}, W(N-1) = -\frac{N}{4}, \text{其余为0}$$

时域卷积: $Y(k) = \frac{1}{N} \sum_{m=0}^{N-1} X(m)W(k-m) = \frac{1}{N} X(k) * W(k)$

代入, $Y(k) = \frac{1}{N} [X(k) \cdot W(0) + X(k-1) \cdot W(1) + X(k+1) \cdot W(N-1)]$

$$= \frac{1}{N} [X(k) \cdot \frac{N}{2} + X(k-1) \cdot (-\frac{N}{4}) + X(k+1) \cdot (-\frac{N}{4})]$$

$$\therefore Y(k) = \frac{1}{2}X(k) - \frac{1}{4}X(k-1) - \frac{1}{4}X(k+1)$$

5. 计算序列 $x(n)$ 的 N 点离散傅里叶变换 (DFT):

$$x(n) = 4 + \cos^2(\frac{2\pi n}{N}), n=0, 1, 2, \dots, N-1$$

$$\text{解: } x(n) = 4 + \frac{1 + \cos\frac{4\pi n}{N}}{2} = \frac{9}{2} + \frac{1}{2}\cos\frac{4\pi n}{N}$$

$$= \frac{9}{2} + \frac{1}{4}e^{j\frac{4\pi n}{N}} + \frac{1}{4}e^{-j\frac{4\pi n}{N}}$$

$$\text{而 } X(k) = \sum_{n=0}^{N-1} x(n)W_N^{kn}, W_N = e^{-j\frac{2\pi}{N}}$$

$$\therefore \text{代入, } X(k) = \frac{9}{2} \sum_{n=0}^{N-1} e^{-j\frac{2\pi kn}{N}} + \frac{1}{4} \sum_{n=0}^{N-1} e^{-j\frac{2\pi(k-1)n}{N}} + \frac{1}{4} \sum_{n=0}^{N-1} e^{-j\frac{2\pi(k+1)n}{N}}$$

由于 $e^{j2\pi k} = 1$, 故 $\sum_{n=0}^{N-1} e^{-j\frac{2\pi kn}{N}} = N$ 当 $m \equiv 0 \pmod{N}$, 否则为0

$$\therefore S_0(k) = N \Leftrightarrow k=0; S_1(k) = N \Leftrightarrow k=1; S_2(k) = N \Leftrightarrow k=N-1$$

∴ 综上, 当 $k=0$ 时, $X(0) = \frac{9}{2}N$; 当 $k=1$ 时, $X(1) = \frac{1}{4}N$;

当 $k=N-1$ 时, $X(N-1) = \frac{1}{4}N$; 其余 k 取值时 $X(k) = 0$

7. 一个有限长序列 $x(n) = \delta(n) + 2\delta(n-5)$, 则:

a). 计算序列 $x(n)$ 的 10 点离散傅里叶变换 (DFT) $X(k)$

$$\text{解: } x(n) = \delta(n) + 2\delta(n-5), N=10$$

①. $\delta(n)$ 的 10 点 DFT: $X_1(k) = 1$ ✓ (所有情况)

$$\text{②. } \delta(n-5) \text{ 的 DFT, 即为 } W_{10}^{5k} = e^{-j\frac{2\pi \cdot 5k}{10}} = e^{-j\pi k} = (-1)^k$$

$$\therefore X(k) = 1 + 2 \cdot (-1)^k, k=0, 1, \dots, 9$$

6. 设 $x(n)$ 是一个 N 点时间序列, 其 DFT 是 $X(k)$, $w(n)$ 是汉明窗:

$$w(n) = \frac{1}{2} + \frac{1}{2}\cos[\frac{2\pi}{N}(n - \frac{N-1}{2})], \text{对 } x(n) \text{ 加窗后得 } x_w(n)$$

$w(n)$, 用 $X(k)$ 计算该加窗后序列的 DFT.

解: 汉明窗 $w(n)$ 可对频谱处去除/减轻跳变影响

本题的意思是有原版的 $X(k)$, 可快速导出加 $w(n)$ 后的 $X_w(k)$

$$w(n) = \frac{1}{2} + \frac{1}{2}\cos[\frac{2\pi}{N}(n - \frac{N-1}{2})] = \frac{1}{2} + \frac{1}{2}\cos(\frac{2\pi n}{N} - \pi)$$

b). 如果序列 $y(n)$ 的 DFT 为 $Y(k) = e^{j\frac{2\pi k}{10}} X(k)$, 其中 $X(k)$ 是 $x(n)$ 的 10 点 DFT, 求序列 $y(n)$.

解: 基本方法: 乘以 $e^{-j\frac{2\pi k}{10} \cdot m}$ 则右移, $e^{j\frac{2\pi k}{10} \cdot m}$ 则左移

这里是 $j\frac{2\pi}{10}$, $m=2$, 则左移 2 位.

✓ $0 \rightarrow -2$, 即 8; $5 \rightarrow 3$.

$$\text{故 } y(n) = 2\delta(n-3) + \delta(n-8)$$

8. 序列 $x(n)$ 为: $x(n) = 2\delta(n) + \delta(n-1) + \delta(n-3)$.

计算 $x(n)$ 的 5 点 DFT $X(k)$, 然后计算 $Y(k) = X^*(k)$, 求

$Y(k)$ 的 5 点 DFT 反变换 $y(n)$.

解: ① 先求 5 点 DFT: $W_5 = e^{-\frac{j2\pi}{5}}$.

$$x(0) = 2, x(1) = 1, x(2) = 0, x(3) = 1, x(4) = 0 \quad \checkmark$$

$$\therefore X(k) = \sum_{n=0}^4 x(n) (W_5)^{kn} = 2 + 1 \cdot W_5^k + 1 \cdot W_5^{3k}$$

$$\text{即 } X(k) = 2 + W_5^k + W_5^{3k}$$

$$\text{② 再算圆周卷积: } y(n) = x(n) * x(n) = \sum_{m=0}^4 x(m) x(n-m)$$

$$y(0) = 4, y(1) = 5, y(2) = 1, y(3) = 4, y(4) = 2$$

$$\therefore y(n) = \{4, 5, 1, 4, 2\}, n = 0, 1, 2, 3, 4$$

9. 请用 Z 变换计算两个序列卷积: $h(n) = (0.5)^n \cdot u(n)$,

$$x(n) = 3^n \cdot u(-n)$$

$$\text{解: } h(n) \text{ 为右边序列, } H(z) = \sum_{n=0}^{\infty} (0.5)^n z^{-n} = \sum_{n=0}^{\infty} (0.5z^{-1})^n$$

$$\text{几何求和} \Rightarrow H(z) = \frac{z}{z-0.5}, |z| > 0.5 \quad \checkmark$$

$$x(n) \text{ 为左边序列, } X(z) = \sum_{n=-\infty}^0 3^n z^{-n} = \sum_{m=0}^{\infty} \left(\frac{z}{3}\right)^m$$

$$\text{几何求和} \Rightarrow X(z) = \frac{1}{1-\frac{z}{3}} = \frac{3}{3-z} = -\frac{3}{z-3}, |z| < 3 \quad \checkmark$$

$$\text{则 } Y(z) = H(z) \cdot X(z) = \left(\frac{z}{z-0.5}\right) \cdot \left(-\frac{3}{z-3}\right) = -\frac{3z}{(z-0.5)(z-3)}$$

总收敛域为 $0.5 < |z| < 3$.

$$\text{而 } Y(z) = 1.2 \times \frac{z}{z-0.5} - 1.2 \times \frac{z}{z-3}$$

第一项: 右边序列, 复原为 $1.2 \times (0.5)^n u(n)$

第二项: 左边序列, 复原为 $1.2 \times 3^n \times u(-n-1)$

$$\therefore \text{合并 } y(n) = 1.2 \times 0.5^n u(n) + 1.2 \times 3^n u(-n-1)$$

10. 求 $x(n] = \left(\frac{1}{2}\right)^n u(n) - 2^n u(-n-1)$ 的 Z 变换.

解: 第一项: 右边序列 $\Rightarrow X_1(z) = \frac{1}{1-0.5z^{-1}}, |z| > 0.5$

第二项: 左边序列 $\Rightarrow -b^n u(-n-1) \rightarrow \frac{1}{1-bz^{-1}}, b > 2$

$$\therefore X_2(z) = \frac{1}{1-2z^{-1}}, |z| < 2$$

$$\therefore X(z) = \frac{1}{1-0.5z^{-1}} + \frac{1}{1-2z^{-1}}, 0.5 < |z| < 2 \quad \checkmark$$

11. 有一个信号 $y(n]$ 与另两个信号 $x_1(n]$ 和 $x_2(n]$ 的关系是:

$$y(n] = x_1(n+3) * x_2(-n+1), \text{ 其中 } x_1(n] = \left(\frac{1}{2}\right)^n u(n],$$

$$x_2(n] = \left(\frac{1}{3}\right)^n u(n], \quad \text{需要时移}$$

已知 $Z[a^n u(n)] = \frac{1}{1-az^{-1}}, |z| > |a|$, 利用 Z 变换求 $y(n]$ 的 Z 变换 $Y(z)$.

$$\text{解: } x_1(n] = \left(\frac{1}{2}\right)^n u(n] \Rightarrow X_1(z) = \frac{1}{1-\frac{1}{2}z^{-1}}, |z| > \frac{1}{2}$$

$$x_2(n] = \left(\frac{1}{3}\right)^n u(n] \Rightarrow X_2(z) = \frac{1}{1-\frac{1}{3}z^{-1}}, |z| > \frac{1}{3}$$

$$x_1(n+3) \Rightarrow z^3 X_1(z), X_{1a}(z) = z^3 \cdot \frac{1}{1-\frac{1}{2}z^{-1}} = \frac{z^3}{1-\frac{1}{2}z^{-1}} \quad \text{①}$$

$$\text{而 } x_2(-n) \Rightarrow X_2(z^{-1}) = \frac{1}{1-\frac{1}{3}z}, \text{ 时移后 } X_{2a}(z) = z^{-1} \cdot \frac{1}{1-\frac{1}{3}z} \quad \text{②}$$

$$\therefore y(n] = x_{1a}(n+3) * x_{2a}(-n+1) \text{ 的 Z 变换为}$$

$$Y(z) = X_{1a}(z) \cdot X_{2a}(z) = \frac{z^2}{(1-\frac{1}{2}z^{-1})(1-\frac{1}{3}z)}$$

$$= z^2 \cdot \frac{1}{z-0.5} \cdot \frac{z-3}{z} = \frac{6z^3}{(2z-1)(3-z)}, \frac{1}{2} < |z| < 3$$

12. 计算序列 $x(n] = A r^n \cos(\omega_0 n + \varphi) u(n)$, $0 < r < 1$ 的 Z

变换, 并在 Z 平面上画出收敛区域, 并同时标出零点和极点.

解: 余弦先写成复指数:

$$\cos(\omega_0 n + \varphi) = \frac{e^{j(\omega_0 n + \varphi)} + e^{-j(\omega_0 n + \varphi)}}{2}$$

$$x(n) = A r^n u(n) \cdot \frac{e^{j\varphi} e^{j\omega_0 n} + e^{-j\varphi} e^{-j\omega_0 n}}{2}$$

$$= \frac{A e^{j\varphi}}{2} (r e^{j\omega_0})^n u(n) + \frac{A e^{-j\varphi}}{2} (r e^{-j\omega_0})^n u(n)$$

$$\therefore X(z) = \frac{A e^{j\varphi}}{2} \cdot \frac{1}{1 - r e^{j\omega_0} z^{-1}} + \frac{A e^{-j\varphi}}{2} \cdot \frac{1}{1 - r e^{-j\omega_0} z^{-1}}, |z| > r$$

$$= \frac{A}{2} \cdot \frac{e^{j\varphi} (1 - r e^{-j\omega_0} z^{-1}) + e^{-j\varphi} (1 - r e^{j\omega_0} z^{-1})}{(1 - r e^{j\omega_0} z^{-1})(1 - r e^{-j\omega_0} z^{-1})}$$

分母为 $1 - r z^{-1} (e^{j\omega_0} + e^{-j\omega_0}) + r^2 z^{-2} = 1 - 2r \cos \omega_0 z^{-1} + r^2 z^{-2}$

分子为 $e^{j\varphi} + e^{-j\varphi} - r z^{-1} [e^{j\varphi} e^{-j\omega_0} + e^{-j\varphi} e^{j\omega_0}]$

$$= 2 \cos \varphi - r z^{-1} [e^{j(\varphi - \omega_0)} + e^{-j(\varphi - \omega_0)}]$$

$$= 2 \cos \varphi - 2 r z^{-1} \cos(\varphi - \omega_0)$$

$$\therefore X(z) = \frac{A}{2} \cdot \frac{2 \cos \varphi - 2 r z^{-1} \cos(\varphi - \omega_0)}{1 - 2 r \cos \omega_0 z^{-1} + r^2 z^{-2}} = A \cdot \frac{\cos \varphi - r z^{-1} \cos(\varphi - \omega_0)}{1 - 2 r \cos \omega_0 z^{-1} + r^2 z^{-2}}$$

乘以 z^2 : $X(z) = A \cdot \frac{z^2 \cos \varphi - r z \cos(\varphi - \omega_0)}{z^2 - 2 r \cos \omega_0 z + r^2}$

① 极点: 分母为 0: $z = r e^{\pm j\omega_0}$. C_1, C_2

② 零点: 分子为 0 $\Rightarrow z=0$ 或 $z = \frac{r \cos(\varphi - \omega_0)}{\cos \varphi}$ ($\cos \varphi \neq 0$)

③ 收敛域: $|z| > r$

13. 计算以下 $X(z)$ 的 z 反变换:

a). $X(z) = \frac{1 - 2z^{-1}}{1 - \frac{1}{4}z^{-1}}, |z| < \frac{1}{4}$

解: $X(z) = \frac{1 - \frac{1}{4}z^{-1} - \frac{3}{4}z^{-1}}{1 - \frac{1}{4}z^{-1}} = 1 - \frac{\frac{3}{4}z^{-1}}{1 - \frac{1}{4}z^{-1}}$

① 1 项变换: $\tilde{x}_1(n) = \delta(n)$

②. $-\frac{\frac{3}{4}z^{-1}}{1 - \frac{1}{4}z^{-1}}$ 项变换: 利用 $z^{-1}X(z) \Leftrightarrow x(n-1)$

$$\therefore \tilde{x}_2(n) = -\frac{3}{4} \cdot [(-\frac{1}{4})^{n-1} u(-(n-1)-1)] = 7 \times (\frac{1}{4})^n u(-n)$$

$$\therefore x(n) = \tilde{x}_1(n) + \tilde{x}_2(n) = \delta(n) + 7 \times (\frac{1}{4})^n u(-n)$$

b). $X(z) = \frac{z-a}{1-az}, |z| > |a|$

解: 先化为标准形式: $X(z) = \frac{z-a}{-az(1-\frac{1}{a}z^{-1})}$

$$= -\frac{1}{a} \cdot \frac{1}{1-\frac{1}{a}z^{-1}} + \frac{z^{-1}}{1-\frac{1}{a}z^{-1}}$$

由于 $|z| > |a|$ 故为右边序列, 套用 $\frac{1}{1-az^{-1}} \Leftrightarrow a^n u(n)$

① 第一项: $\tilde{x}_1(n) = -\frac{1}{a} (\frac{1}{a})^n u(n) = -(\frac{1}{a})^{n+1} u(n)$

② 第二项: $\tilde{x}_2(n) = (\frac{1}{a})^{n-1} u(n-1)$

$$\therefore x(n) = \tilde{x}_1(n) + \tilde{x}_2(n) = -(\frac{1}{a})^{n+1} u(n) + (\frac{1}{a})^{n-1} u(n-1) \checkmark$$

而 $u(n) = u(n-1) + \delta(n)$, 故代入化简,

$$x(n) = -\frac{1}{a} \delta(n) + (a - \frac{1}{a}) (\frac{1}{a})^n u(n-1)$$

14. 求 $x(n) = |n| \cdot (\frac{1}{2})^{|n|}$ 的 z 变换.

解: 由于有绝对值, 故分为左右两边.

$$x(n) = n (\frac{1}{2})^n u(n) + (-n) (\frac{1}{2})^{-n} u(-n-1)$$

① 第一项: 多出了 n , 原本 $X(z) = \sum x(n) z^{-n}$, 两边求导凑 n .

$$\frac{dX(z)}{dz} = \sum x(n) \cdot (-n) z^{-n-1} \Leftrightarrow -z \frac{dX(z)}{dz} = \sum [n x(n)] z^{-n}$$

故多了一个乘积因子 n , 可以直接对原本结果 $-z \frac{d}{dz}$.

$$\text{故 } \tilde{x}_1(z) = \frac{d}{dz} \left(\frac{1}{1-0.5z^{-1}} \right) \cdot (-z) = -z \frac{-0.5z^{-2}}{(1-0.5z^{-1})^2} = \frac{0.5z}{(z-0.5)^2}$$

② 第二项: $\tilde{x}_2(z) = \sum_{n=-\infty}^{-1} (-n) (\frac{1}{2})^{-n} z^{-n}$

$$= \sum_{m=1}^{\infty} m \cdot 0.5^m z^m = \sum_{m=1}^{\infty} m (0.5z)^m$$

而 $\sum q^n = \frac{1}{1-q}$, 求导得 $\sum m q^{m-1} = \frac{1}{(1-q)^2}$, 故 $\sum m q^m = \frac{q}{(1-q)^2}$

$$\therefore \tilde{x}_2(z) = \frac{0.5z}{(1-0.5z)^2}$$

综上, $X(z) = \tilde{x}_1(z) + \tilde{x}_2(z) = \frac{0.5z}{(z-0.5)^2} + \frac{0.5z}{(1-0.5z)^2}$

$$= \frac{z}{(2z-1)^2} + \frac{z}{(2-z)^2}$$

15. 用 $x(n)$ 的 z 变换求 $y(n) = \sum_{k=-\infty}^n x(k)$ 的 z 变换.

解: 时域卷积 $\Rightarrow$ z 域相乘 $\checkmark$

$$y(n) = \sum_{k=-\infty}^n x(k) = \sum_{k=-\infty}^{\infty} x(k) u(n-k) = x(n) * u(n)$$

$$\text{而 } u(n) = 1^n \cdot u(n) \Rightarrow U(z) = \frac{1}{1-z^{-1}}, |z| > 1$$

$$\text{由卷积定理, } Y(z) = X(z) \cdot U(z) = \frac{X(z)}{1-z^{-1}}$$

$$\therefore Y(z) = \frac{X(z)}{1-z^{-1}}, \text{ 收敛域为 } R_x \cap |z| > 1$$

11. 求 $X(z) = \log(1 - \frac{1}{2}z^{-1})$ 的反变换.
 (收敛域为 $|z| > \frac{1}{2}$)

$$\text{解: 令 } w = \frac{1}{2}z^{-1}, \text{ 则 } |w| = \frac{1}{2|z|} < 1 \text{ (} |z| > \frac{1}{2} \text{)}$$

$$\text{展开得: } X(z) = \log(1-w) = -\sum_{n=1}^{\infty} \frac{w^n}{n} \quad (|w| < 1)$$

$$= -\sum_{n=1}^{\infty} \frac{1}{n} \left(\frac{1}{2}z^{-1}\right)^n = -\sum_{n=1}^{\infty} \frac{1}{n} \left(\frac{1}{2}\right)^n z^{-n}$$

$$\text{而 z 变换中 } X(z) = \sum_{n=-\infty}^{\infty} x(n) z^{-n}$$

$$\text{故 } x(n) = \begin{cases} -\frac{1}{n} \left(\frac{1}{2}\right)^n, & n > 1 \\ 0, & n \leq 0 \end{cases}$$

(级数只有正项)

$$\therefore x(n) = -\left(\frac{1}{2}\right)^n \cdot \frac{1}{n} u(n-1) \quad (x(0) = 0)$$
